## RESIDENTIAL CONSTRUCTION HOLDING STEADY

URING 1957 the construction of new family dwelling units in the principal metropolitan areas of the United States has been proceeding at a constant rate. The movement during 1957, as can be seen from the chart at the bottom of this page, has been sideways in contrast with the downward movement in 1956. The highest rate of building has been in metropolitan areas of from 500,000 to 1,000,000, and the second highest rate in areas of from 250,000 to 500,000. The slowest rate of construction has been in the very small areas and the very large ones.

The map on the following page shows the cities where residential construction in the first half of 1957 exceeded the first half of 1956, and those cities in which the number of dwelling units in 1957 was less than it was a year ago. It (cont. on page 418)

	8 months   8 months		Change 1956-57	
	1956	1957	No.	%
Total nonfarm starts	789,600	700, 500	-89, 100	-11.3
In metropolitan areas	552, 700	477, 100	-75, 600	-13.7
In nonmetropolitan areas	236,900	223, 400	-13, 500	-5.7

## **EXPLANATION OF CHARTS**

Residential building in all metropolitan areas of the United States as defined by the 1950 Census is charted on the following pages. The 168 areas include all areas in which the central city had a 1950 population of more than 50,000.

In each city all suburbs, incorporated and unincorporated areas, have been contacted and every effort has been made to make this report as complete as possible. In most cities it has been possible to include practically all of the suburbs within the metropolitan area. For example, the New York City and Northeastern New Jersey area figures include the building in 344 suburban communities; the Chicago area includes building in 174 suburban communities; Philadelphia, 198; Detroit, 110; Los Angeles, 61; and Cleveland, 65. In all, more than 2,300 communities are represented in these charts.

On the charts the figures are expressed as the number of new family units started per 10,000 families in each metropolitan area as indicated by building permits. In non-permitissuing areas, we requested the tax clerk to report to us the number of dwelling units added to the tax roll each month. In this computation, a single-family dwelling counts 1, a 2-family dwelling counts 2, and a 24-family apartment counts 24. All public housing and war housing projects have been included, along with buildings that were privately built and financed.

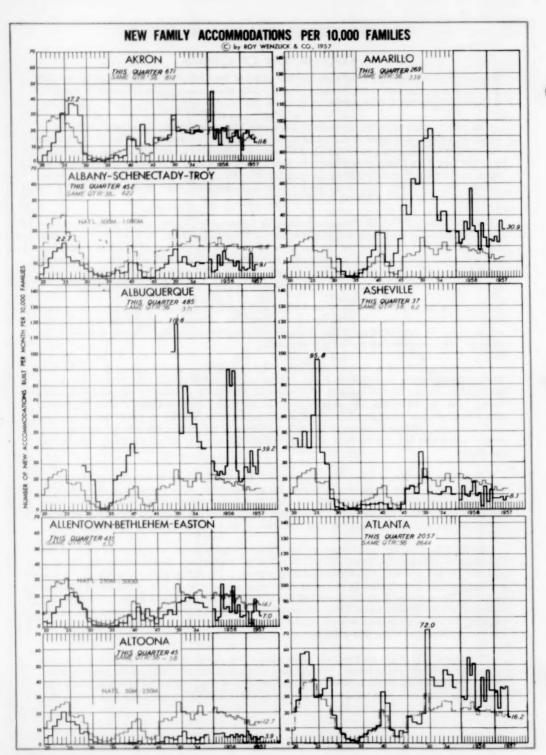

The blue italicized numerals on each chart give the number of new family accommodations built in the last 3 months for which figures are available. These are actual figures and are not adjusted for the number of families. The red italicized numerals give the corresponding figures for the corresponding period of a year ago.

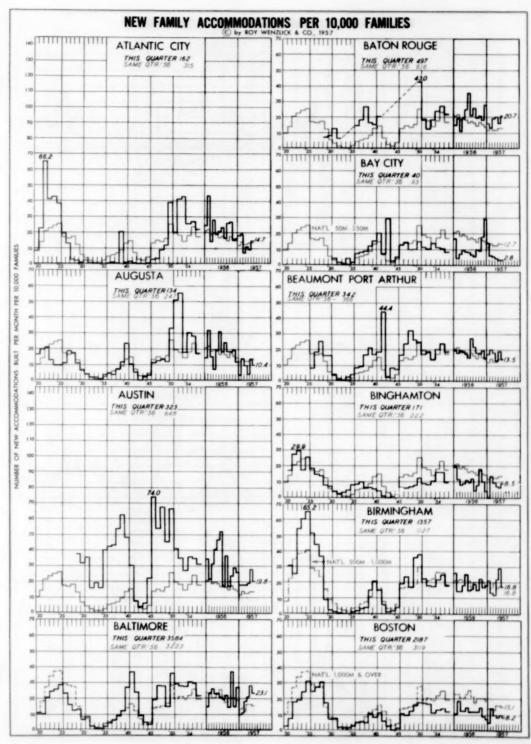

It should be noticed on the individual charts that separate averages (medians) have been used for four groupings of metropolitan areas. The average number of new family accommodations built per month per 10,000 families is shown from 1920 to the present for metropolitan areas having from 50,000 to 250,000 people (the solid red line); for areas having from 250,000 to 500,000 people (the beaded red line); for areas having from 500,000 to 1,000,000 people (the dash-dot line); and for those areas having a population of over 1,000,000 (the dashed red line). Ninety-one areas fall into the first category; 44 into the second; 19 into the third; and 14 into the fourth.

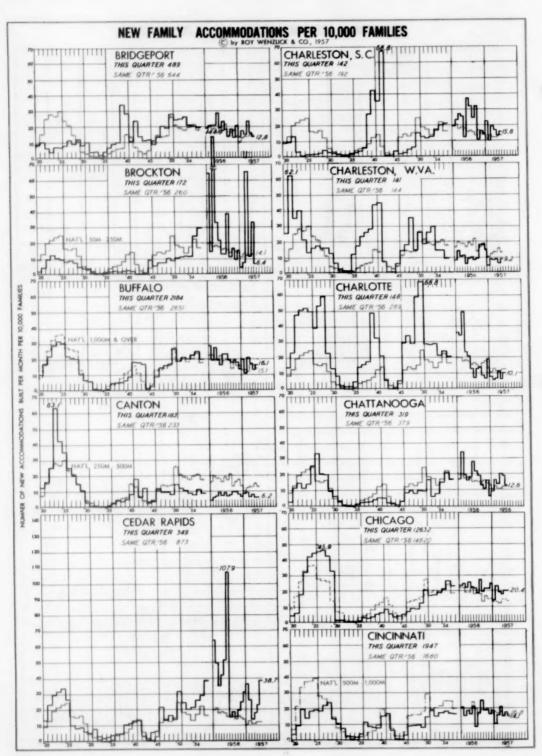

On each area chart is shown in red the national average for areas in its grouping in contrast to the blue line, which shows the figures for the specific area. The averages used on the area charts are medians. A median average is found by arranging the data in order of size and selecting the amount at the midpoint. Because a median average thus eliminates the influence of the two extremes, it gives a very good picture of the typical area in each group.

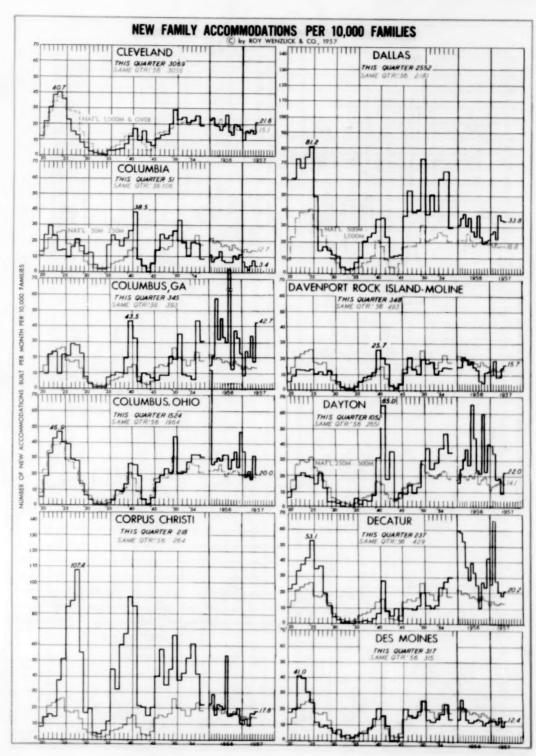

On the chart on the front page we have also shown national averages for each of the groupings of metropolitan areas: (1) 50,000 to 250,000 population; (2) 250,000 to 500,000 population; (3) 500,000 to 1,000,000 population; and (4) 1,000,000 population and over. These averages should more properly be called arithmetic means. An arithmetic mean is obtained by adding the amounts of all the items and then dividing by the number of items. It will be noticed that the arithmetic mean, being influenced by areas with a greatly accelerated rate of new building, is above the median average of each of the groupings. The arithmetic means are given for each grouping in order that a comparison of new building on a volume basis may be made.

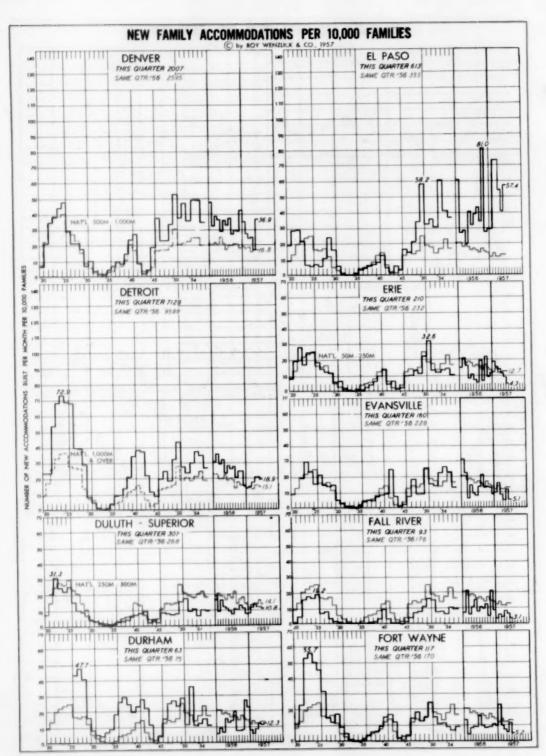

We repeat, the chart on the front page shows the <u>arithmetic mean</u> of the construction rate in the different-sized areas. The red line on each of the individual charts shows the <u>national average</u> for the group in which each area belongs, making it possible to compare the rate in one area (blue line) with the average rate of all other areas of comparable size (red line).

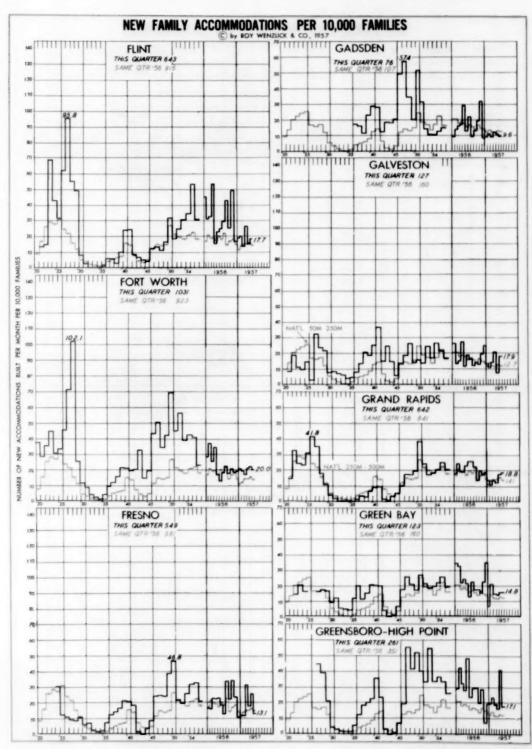

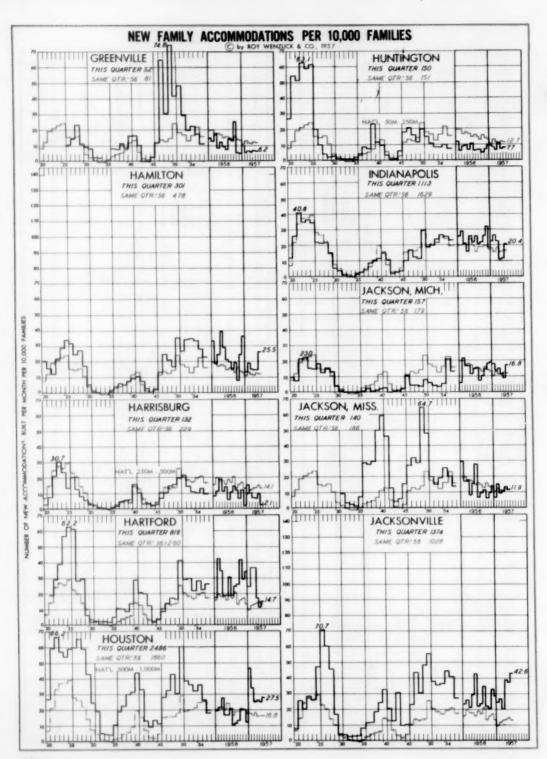

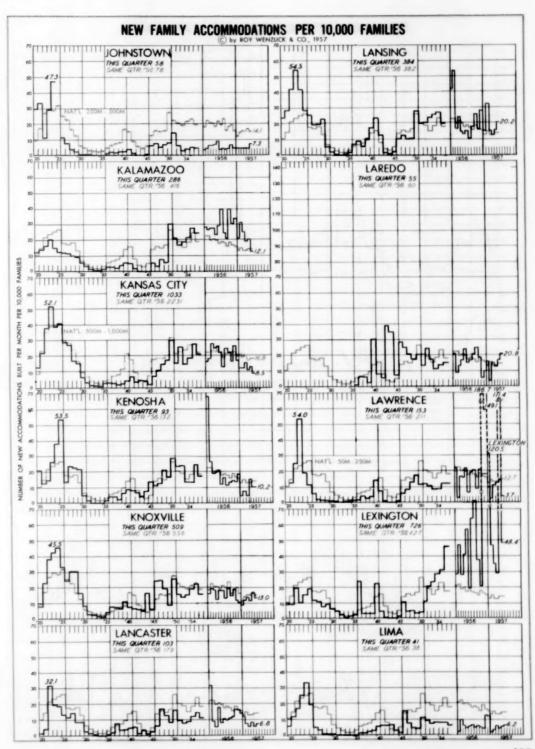

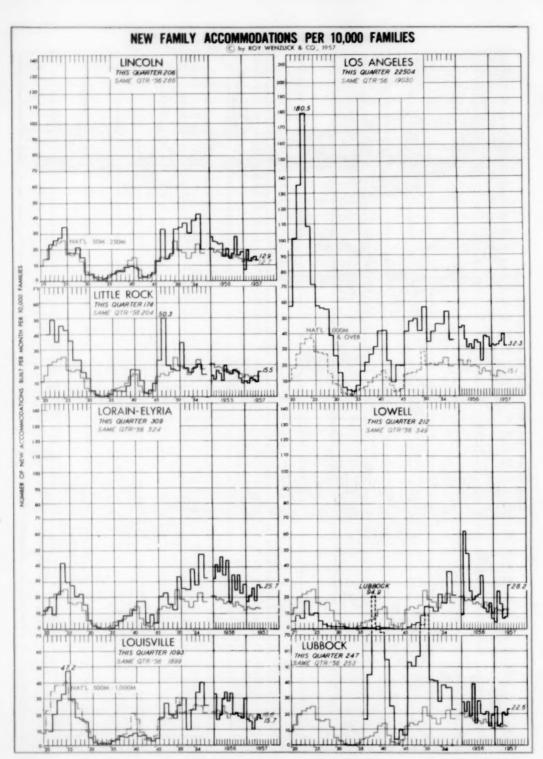

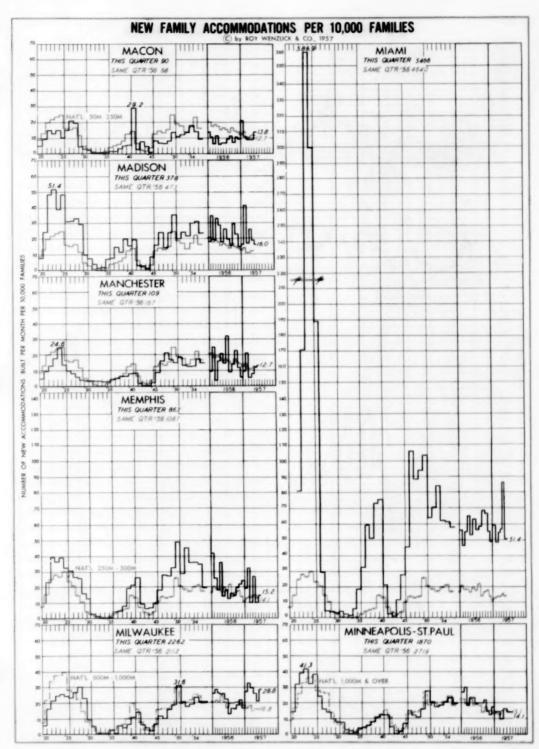

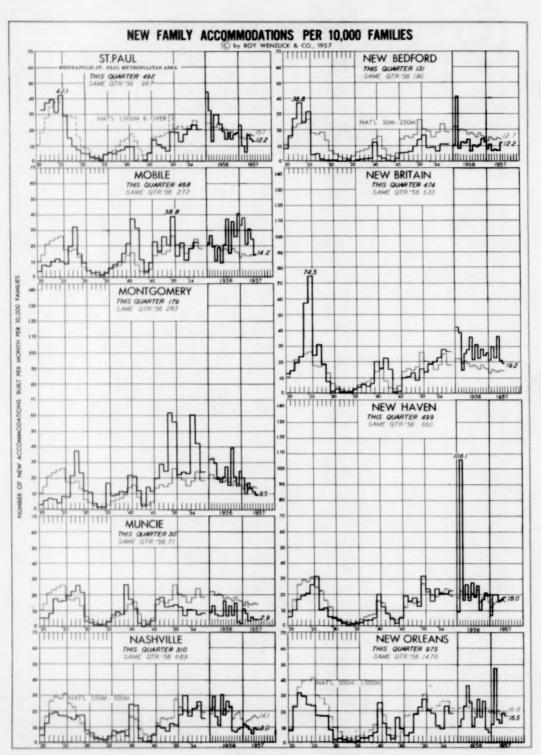

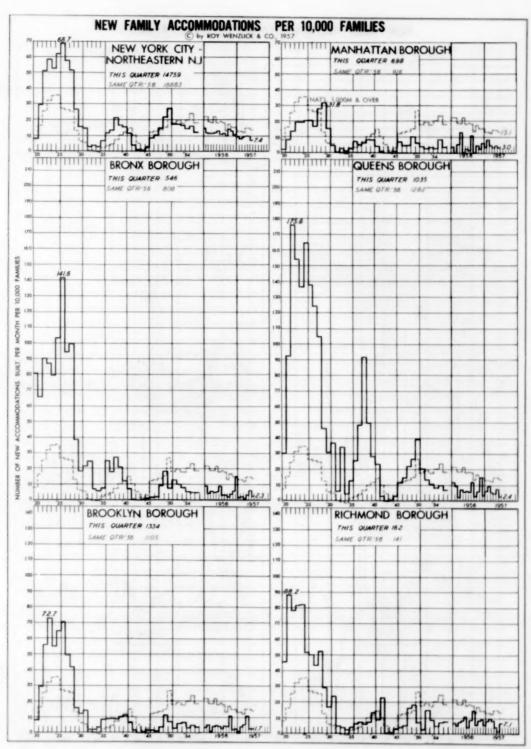

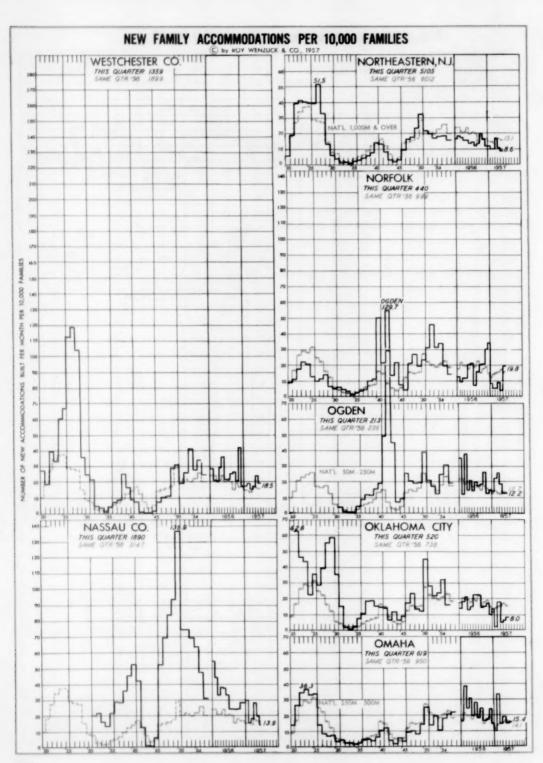

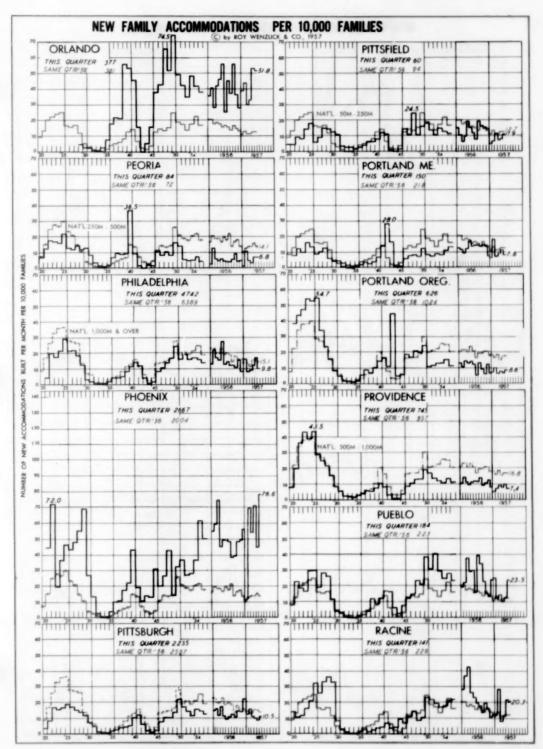

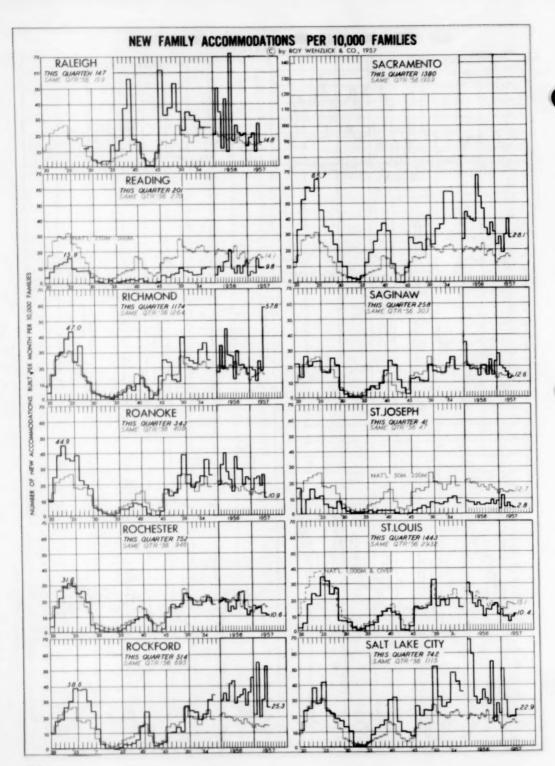

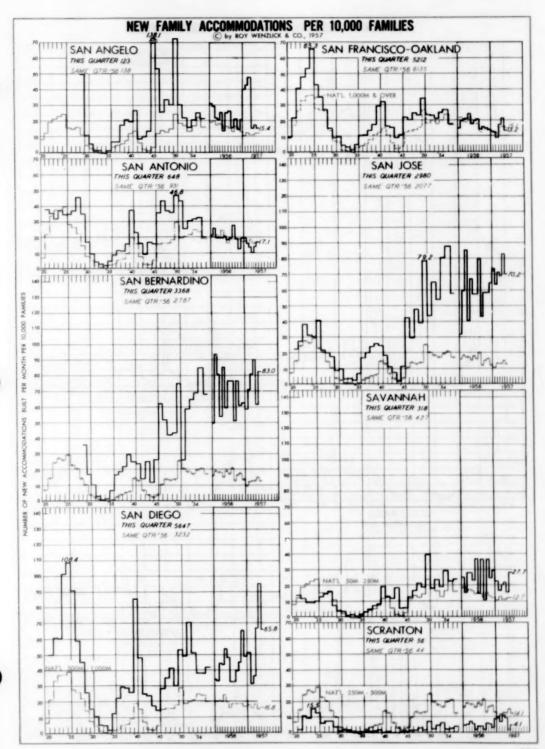

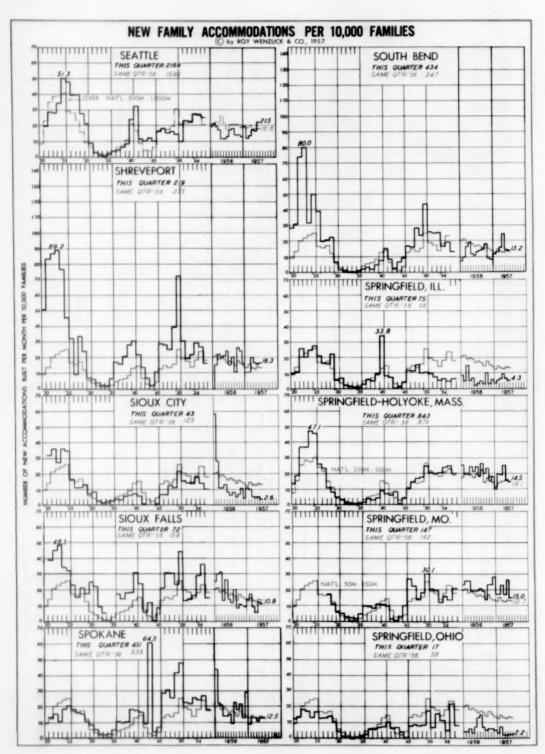

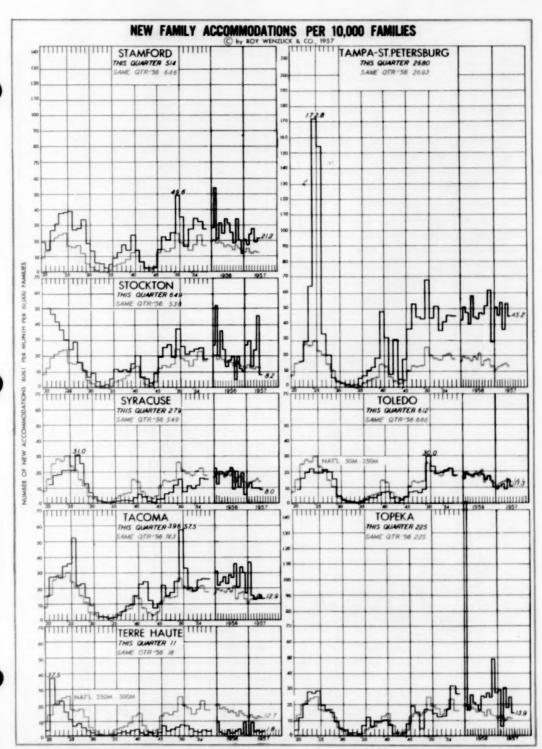

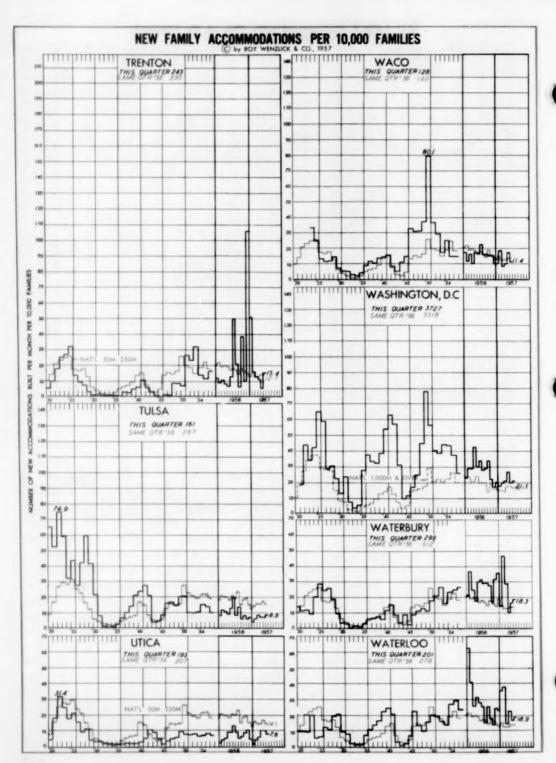

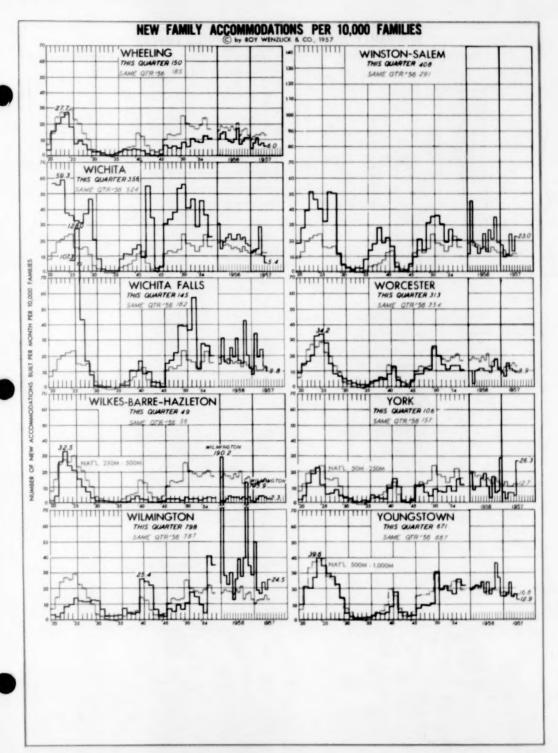

(cont. from page 395)

will be noticed that practically all parts of the United States have suffered from the decline in residential building, with the exception of the State of Florida, where all cities are reporting a gain.

Figures are now available on practically all metropolitan areas of the United States for the first 8 months of 1957. The table on page 395 shows total nonfarm starts, starts in metropolitan areas, and starts in nonmetropolitan areas for this period compared with the first 8 months of 1956. This table would indicate that the starts in metropolitan areas have declined by the greatest percentage, with starts in nonmetropolitan areas having the smallest drop. This is a repetition of the pattern which developed in the early part of the year.
